Platform Progress & Feature Delivery Report — Upclick Project

1. Booking & Calendar Experience Upgrade (Koalendar-Style)

- **Cleaner Dashboard & Bookings Layout:** Redesigned the Booking Dashboard and Appointments pages so cards no longer stretch awkwardly across the full screen, adding a clean right-hand workspace summary panel and proper spacing around filters and dates.
- **One-Click Editing & Smooth Details View:** Made booking page cards fully clickable to jump straight into editing, and changed appointment details to open smoothly inside an expandable dropdown card instead of a side panel.
- **Smart Lead Screening Questions:** Added the ability to mark any booking form question as a **Lead Qualification (Screening)** question directly inside the "Your Details" step (removing the extra "Quick Questions" step). If a visitor's answer doesn't qualify, the appointment isn't booked—instead, they see a polite thank-you message, and their info is automatically saved in **CRM & Leads** as a **Pending Booking**.
- **Modern Public Booking Page & Landing Page Styling:** Redesigned the public booking link to match a sleek, step-by-step layout across desktop and mobile, and ensured embedded booking sections blend naturally with any landing page or website template.

2. Performance & Stability Fixes

- **Fixed Dashboard Loading Freeze:** Resolved an issue that caused the User Dashboard to stay stuck on the loading screen so pages open smoothly and reliably.
- **Resolved Dev Server Module Errors:** Fixed dependency cache conflicts so all admin and workspace pages load without interruption.

3. Curated Professional Template Library (GoHighLevel Standard)

- **Cleaned Up Old Demo Templates:** Removed outdated and duplicate templates from **Websites**, **Funnels**, and **Forms** while keeping all other platform and user templates untouched.
- **Added 9 High-Converting Official Templates (3 per Category):**
  - **Websites:** *Framing Construction*, *Life Insurance*, and *Pharmacy*.
  - **Funnels:** *Mortgage Company*, *Brake & Muffler*, and *Locksmith*.
  - **Forms:** *Flooring Quote - Classic*, *Personal Trainer*, and *Architecture Studio*.
- **Synced Super Admin & User Dashboards:** Ensured the User Dashboard displays the exact same curated Websites, Funnels, and Forms as the Super Admin library, and fixed text contrast so card badges remain clear and readable in Light Mode.

4. Super Admin Dashboard Refinements

- **Simplified Wallet Visibility:** Removed the wallet balance widget from the Super Admin top bar and removed the **Meta Wallet** tab from the Super Admin sidebar (keeping wallets exclusively for Admins and Users where needed).
- **Fixed Scrolling & Mobile Layout:** Fixed vertical scrolling on the Super Admin Templates page so all content at the bottom is reachable, and made template grids adapt cleanly to tablet and mobile screens.

5. Full-Width Website & Funnel Previews

- **Edge-to-Edge Display:** Removed the white side margins and boxed borders when previewing or publishing a Website, Funnel, or Form on desktop so pages appear full-width just like a live production website.

6. Automated Customer Accounts & Delivery Portal

- **Automatic Account Creation & Welcome Email:** Whenever a customer buys a **Course**, **Digital Product**, or **Service**, the system now automatically creates a customer account for them (if they don't already have one) and sends an email with their login link, username, and temporary password.
- **Dedicated Customer Portal:** Built a polished, mobile-friendly portal where buyers can watch course video/PDF lessons and track their completion progress, download digital files, or view their service status and book their session—all saved automatically in the cloud.
- **Upgraded "My Purchases" Tab:** Updated the **My Purchases** view so buyers see their active access status, progress, and a direct button to open their purchased items inside the Customer Portal instead of seeing seller editing controls.

Platform Updates Management Summary (Joe Academy, Go Academy & Launch Brand)

Executive Summary

Executive Overview & Scope

- **Work Cycle Deliverables:** The latest update cycle delivered four major platform improvements covering student enrollment, community management, brand building, and a new guided learning journey.
- **Readiness Status:** All features are fully built and verified, awaiting final builds and official go-live deployment steps.
- **Key Metrics:** Features 4 core business areas improved, 14 requested improvements delivered, 19 stages in the new Go Academy journey, and full support for both Arabic and English.

4	14	19	AR / EN
Core Business Areas	Improvements Delivered	Go Academy Stages	Full Bilingual Support

1. Student Enrollment & Access (Joe Academy)

- **Phone Number Tracking:** Staff now record each student's phone number upon addition, displaying it next to their login code in the directory.
- **Automated Welcome Emails:** Newly created student accounts instantly receive an email with a password setup link, with a one-click resend option for staff.
- **Flexible Subscription Duration:** Access periods are no longer fixed at three months; admins, coaches, and sales staff can set custom durations per student and modify them later.
- **Tiered Packages (Low Ticket vs. High Ticket):** Students are classified by package—High Ticket users get full access (Home, Academy, Trainer, Business Fundamentals, Community, Profile), while Low Ticket users get Academy and Profile only, with other sections locked.

Business Value: Faster onboarding, reduced manual follow-up, pricing flexibility for sales teams, and a clear upsell path.

2. Community Moderation & Management

- **Post Approval Workflow:** Student posts are marked as "Under Review" until approved by an admin, and authors are notified upon publication.
- **Group Joining Controls:** Students can view all groups but must request to join, with admins configuring entry rules (direct join, admin approval, or screening questions first).
- **Screening Question Builder:** Admins can design up to 10 questions per group (text, numbers, or choices) with progress bars and review screens for students.
- **Familiar Comment Experience:** Comments display in a threaded layout similar to Facebook, with optional comment approval keeping new replies greyed out as "Under Review".
- **Professional Management Filters:** Unified filter bars across all management tabs allow filtering by group, person, status, quick search, and date ranges.
- **Member Directory:** A centralized member list tracks community enrollments and join dates with community-specific filtering.

Business Value: Protects brand quality, qualifies members before entry, and provides full visibility over community activity.

3. Launch Brand: Faster & Complete Brand Building

- **Centralized AI Account:** All AI features utilize a single managed key from the AI Center with automatic retries for temporary service busy errors.
- **Professional AI Logo Generation:** Integrates OpenAI image generation models with automatic fallback options.
- **Full Dashboard Previews:** Clients view their entire branded dashboard within the preview workspace rather than a cropped view.
- **Performance & Rollout:** Previews load roughly twice as fast and remain responsive when switching views; launching a brand applies the business name, logo, and colors across the entire platform, including page titles and dashboard themes.

Business Value: Provides a smoother, more convincing experience that drives conversion and customer satisfaction.

4. Go Academy: New Guided Learning Journey

- **Interactive Journey:** Replaces the onboarding prototype with a 19-stage, game-like step-by-step learning journey inside the student portal, featuring live progress bars and motivational celebrations.
- **Multimodal Inputs & AI Help:** Students can answer via voice (Arabic or English converted to text) and attach images, backed by AI helpers and a dedicated "Go Academy" chatbot with a coach photo to guide progress.
- **Commercial Pitch Reports:** Generates summary reports at the end of every stage detailing achievements so far.
- **Management Control:** Super Admins can fully manage text, videos, stages, AI usage limits, and chatbot personalities without developer assistance.

Business Value: Takes students from idea to commercial pitch, boosts engagement and completion rates, and allows flexible team updates.

5. Status, Next Steps & Recommendations

- **Deployment Status:** All four areas (Student enrollment, Community moderation, Launch Brand, and Go Academy) are fully built and pending final deployment steps.

Security Recommendation

It is recommended to perform a brief follow-up task to fully secure the AI account key against potential read access by signed-in users, avoiding unexpected AI costs.

Automation & Campaign and Instagram Split

Pull Request (PR #3): https://github.com/technicalsuppoortt-a11y/gos-app/pull/3

Claude Design Artifact: https://claude.ai/artifact/Tjj6yr1YM7nmqHX2i8Batf

Summary

I moved the automation tools (Flow Builder) into a new **Automation & Campaign** section in the main sidebar, and I split Instagram from Facebook Messenger on the Integrations page. I designed it first in Claude Design, then built it in `gos-app` and opened PR #3 against `main`.

1. Design

I made the design on top of the current app look, without changing the Flow Builder itself. It has three screens:

- **Automation & Campaign:** the real `gos-app` sidebar with the new item, and five tabs, each with a colored icon tile in the same style as the dashboard KPI cards.
- **Flow Builder:** the current builder screen, unchanged, opened from the Automation tab.
- **Settings › Integrations:** built from the existing Integrations page, with Instagram as its own card.

2. Automation & Campaign Section

I added a new sidebar item, **Automation & Campaign**, right before **AI Follow-Up**, at `/dashboard/automation`. It reuses the existing AI Follow-Up screens, grouped into five tabs:

1. **Automation:** the current Flow Builder.
2. **Campaign:** a placeholder card for now; the create button is disabled until campaigns are built.
3. **Follow Up:** the existing Automations tab.
4. **Templates:** the existing templates.
5. **Settings & Analysis:** analytics and settings on one page.

Additional Integrations & Access Updates:

- Gave the page the same access permission as AI Follow-Up.
- Added its title to the header and to the global search.
- Kept the AI Follow-Up page exactly as it was.

3. Instagram Separate from Messenger

On **Settings › Integrations**, the single "Facebook & Instagram" card is now two cards: **Facebook Messenger** and **Instagram**. Each one has its own icon, description, capabilities and setup steps. Both cards use the existing Meta connection on the backend, so connecting or disconnecting one also affects the other.

4. Code Updates

Before starting, I pulled the latest `main` on both projects:

- **gos-app:** 22 new commits.
- **ai-follow-up:** moved to the latest `main`; the previous feature branch was already merged there.

Files changed in `gos-app`:

`src/components/layout/UserLayout.tsx`

`src/components/layout/Header.tsx`

`src/router/index.tsx`

`src/pages/DashboardPage.tsx`

`src/pages/settings/useModuleAccess.ts`

`src/pages/AIFollowUp.tsx`

`src/pages/settings/IntegrationsPanel.tsx`

`src/pages/settings/settings.css`

5. Testing

- TypeScript typecheck passes with no errors.
- I tested the sidebar, all five tabs and the Integrations page in the browser using the demo account.

Subject: Domain Registration, DNS Routing, SSL Security & Email Deliverability

Domain Infrastructure, Authentication & Launch Readiness

- **Domain Purchase & Ownership:** Successfully purchased the domain name, secured ownership, and registered it under the organization's account.
- **DNS Configuration:** Fully configured the DNS records (including `A`, `CNAME`, and `MX` records) and pointed them to the target servers and platform services.
- **Security & Encryption:** Enabled and verified the SSL certificate (`HTTPS`) to ensure encrypted data transmission and secure browsing.
- **Email & Authentication Setup:** Configured domain email parameters—including `SPF`, `DKIM`, and `DMARC` protocols—to guarantee high email deliverability and prevent spam filtering.
- **Verification & Launch Readiness:** Completed all system tests to confirm domain stability, ensuring it is fully operational and ready for integration with the main platform.
